

Project Challenge

Retail Supply Chain Sales Performance Analysis

2014-2018

Nurmalita Fitri Ramadani

Agenda

01

Identify

- Understanding business brief and project goals
 - Identify business question to answer
-

02

ETL

- Dataset transformation and check for the data quality
 - Design star schema data model
-

03

Visualization

- EDA using Power BI visualization
 - DAX measurement for profit, revenue, product sold, and return analysis
-

Introduction

Overview

The Sales & Operations Director has a problem:

- The company is growing in revenue year-over-year, but profit margins are shrinking in some product categories, and the sales team cannot explain which sales representative or regions are dragging down performance.
- Access given to the transactional sales database (9,994 order line items from 2014–2017) and a company calendar table.
- The task is to build a trusted data model and a Power BI dashboard that answers the business question, so leadership can make data-driven decisions for the next fiscal year.

Bussiness Question

Q1

Which regions and sales representative that are underperforming?

Q2

Which product categories are most/least profitable?

Q3

How do discounts affect profit margins?

Regional Profitability Insights

\$239K

Total Profit

22.5%

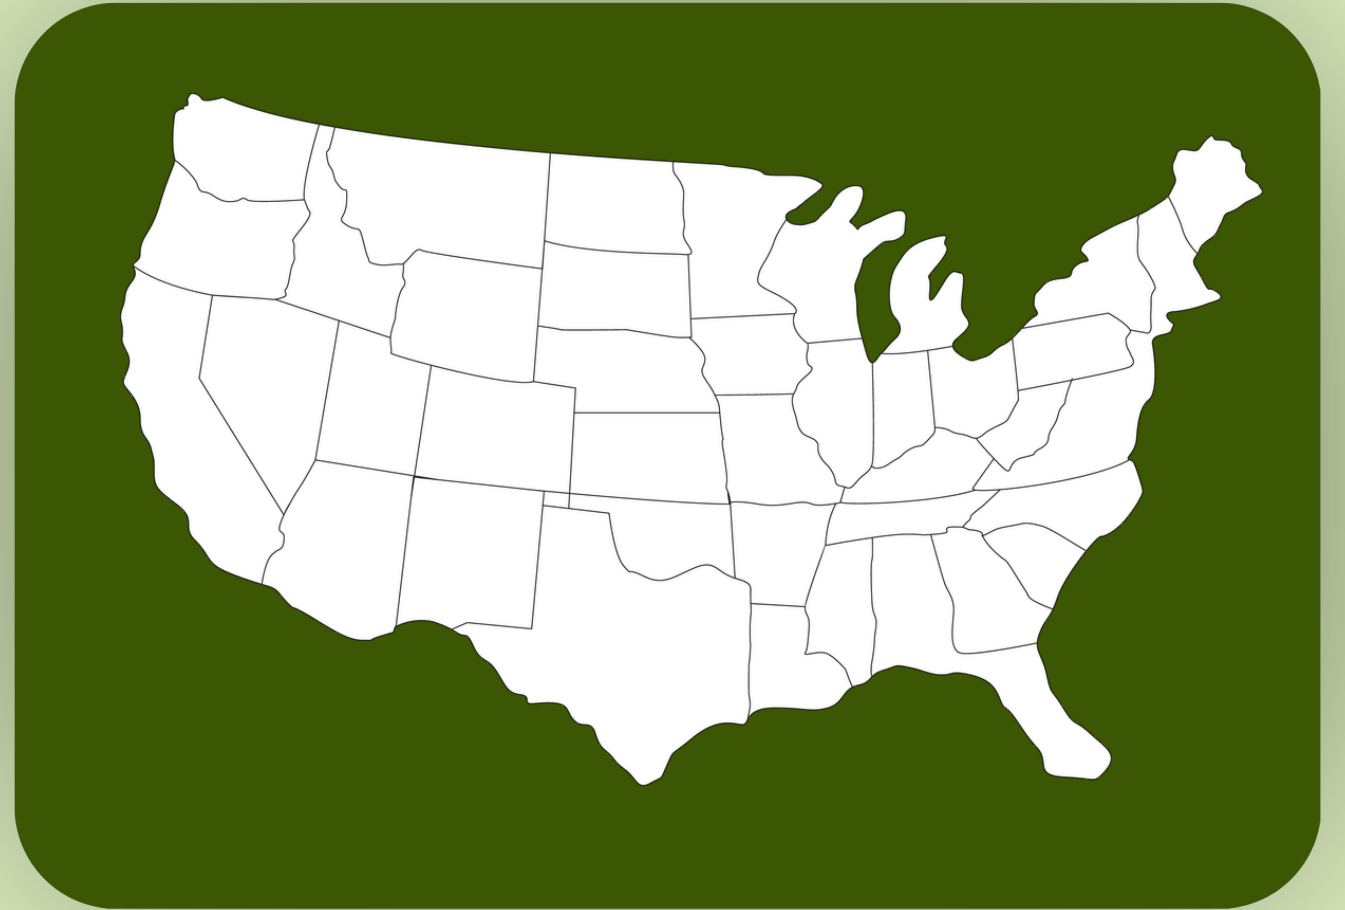

YoY Revenue Growth
(2016-2017)
